If you notice any changes or inconsistencies with our resources, please inform Navigation to help us stay current.

What is Sensory Processing Disorder?

Sensory processing disorder (SPD), also known as sensory integration disorder (SID), is a term describing a collection of challenges that occur when the senses fail to respond properly to the outside world (Psychology Today, n.d.). It is a condition that exists when sensory signals don't get organized into appropriate responses.

A person with SPD finds it difficult to process and act upon information received through the senses, which creates challenges in performing countless everyday tasks. Motor clumsiness, behavioral problems, anxiety, depression, school failure, and other impacts may result if the disorder is not treated effectively (SPD Foundation, 2022).
